PROFILE SUMMARY

Prompt Engineer who builds and ships real, working AI products by directing large language models rather than writing code line-by-line. Designs system prompts, prompt chains, and agentic workflows that turn LLMs into reliable application components, translating product ideas into working software through precise instruction design, iterative testing, and prompt-level debugging. Currently expanding into Applied AI Engineering, building end-to-end LLM-integrated systems beyond prompt design alone.

CORE EXPERTISE

- Prompt Engineering & Design — system prompts, few-shot examples, chain-of-thought structuring, output formatting control
- LLM Application Architecture — integrating Gemini API into multi-step, production-style workflows
- AI Agent Workflows — building and orchestrating agent pipelines; expanding into LangChain and n8n for autonomous, multi-tool agents
- AI-Assisted Development — directing AI coding tools ("vibe-coding") to design, build, and ship full-stack products end-to-end
- Automation Tooling — built a Node.js/Puppeteer script that auto-regenerates and redeploys resume PDFs from live portfolio data, removing manual export steps from the update workflow
- Prompt Debugging & Evaluation — iterating on prompt failures, hallucination control, and output consistency across edge cases
- API & Deployment — designing REST API endpoints, containerizing services with Docker, and testing across staging/production environments

EXPERIENCE

4Layers — Smart Home IoT Solution | 2026 - Present

Client Project | IoT & Full-Stack Automation | React Native, FastAPI, MQTT, PostgreSQL, Expo, Docker

- Built a home automation platform with a React Native/Expo client and FastAPI backend, supporting bulk control and scheduling across up to 6 rooms, each running a 7-channel hardware board (4 lights, fan, dimmer, and master switch) — 40+ controllable endpoints per home
- Integrated MQTT (EMQX) broker connection and JSON payload routing on ESP32 microcontrollers, delivering real-time device control and telemetry updates in under few-second
- Engineered a camera-based QR provisioner to scan, pair, and register device hardware profiles instantly, cutting device setup time from a multi-step manual process to under 2 - 3 - seconds, with manual Node ID fallbacks
- Designed and secured REST API endpoints with JWT-based authentication and role-based access, connecting the mobile client, backend, and device layer
- Containerized backend services with Docker for consistent deployment across development and staging environments

PROJECTS

AutoApply AI — Automated Job Application System | April - May 2025

Self-Initiated | AI Automation | Python, JavaScript, Gemini AI

- Designed a multi-step prompt chain that reads a job description, extracts requirements, and generates a tailored resume and cover letter through structured LLM calls, significantly cutting per-application customization time compared to manual writing
- Engineered system prompts to keep Gemini's output format, tone, and length consistent across hundreds of varying job postings
- Built fallback and retry prompt logic to handle malformed or incomplete model outputs, improving reliability in production use
- Tested prompt output across a wide range of real job postings spanning multiple roles and industries before deployment

Analyst.AI — Full-Stack AI Analytics Platform | June To September/ 2025

Self-Initiated | Frontend Architecture & BI | React, TypeScript, Recharts, Gemini AI

- Directed end-to-end product development — frontend, ETL pipeline, and SQL engine — using AI-assisted, prompt-first development
- Built an AI chat interface that converts natural-language questions into SQL queries via prompt-driven query generation

- Designed prompt templates for the ML Lab module to explain model outputs and surface insights in plain language for non-technical users
- Implemented and tested a serverless API proxy to secure provider keys across deployment environments

Interactive Portfolio & PDF Automation Pipeline | *November To December/ 2025*

Self-Initiated | *Frontend & DevOps Automation* | *React, TypeScript, Framer Motion, Node.js, Puppeteer, TailwindCSS*

- Engineered an interactive React/TypeScript portfolio featuring hardware-accelerated Framer Motion animations, a responsive terminal interface, and a system theme-matching toggle
- Automated resume exports by building a Node.js script using Puppeteer to dynamically scrape the live portfolio build and compile a pixel-perfect A4 PDF resume
- Optimized bundle loading and routing to achieve fast load times and clean responsiveness across all viewport layouts

TECHNICAL SKILLS & COMPETENCIES

- AI / LLM: Gemini API, Prompt Engineering, LangChain (expanding), n8n (expanding)
- Languages & Data: Python, SQL, DuckDB
- Frontend: React, TypeScript, TailwindCSS

EDUCATION

B.Tech, Computer Science — RGPV | *2021 to 2025*

CERTIFICATIONS & LEARNING

- Python for Data Analysis & Visualization — Self-directed
- SQL for Data Analytics — Relational Database Workflows
- Generative AI with Gemini — Prompt Engineering
- Power BI — Interactive Dashboard Design & Reporting
